

Django project - feedback system

Instructions

Django Lab project

Create a Simple Feedback System in Django

Objective

Design and implement a feedback system in Django where users can leave feedback for specific items (e.g., products or articles). This lab covers models, forms, views, templates, and URL configurations.

Project Requirements

This project should cover the following core features of Django:

Part 1: Setting up the Project and App

1. Create a GitHub repository as 'ET721_lab_feedback'. After it, open the repository in codespace.
2. In codespace:
 - Install the python virtual environment.
 - Connect to the virtual environment and run the Django app to test.

```
python manage.py runserver
```

3. Set Up Django Project

- Create a new Django project named 'feedbackproject'.
- Inside this project, create a Django app called 'feedback'.

4. Configure Settings

- Add the feedback app to the INSTALLED_APPS list in your project's 'settings.py' file.

Part 2: Define the Model

In this part, you will define a single model to represent blog posts.

1. Feedback Model

In feedback/models.py, create a model for feedback posts with the following fields:

- Define an Item model with a name field.
- Define a Feedback model with:
 - A ForeignKey to the Item model.
 - A comment field for user feedback.
 - A rating field for numerical ratings (e.g., 1 to 5).
 - A created_at field to store the timestamp.

2. Run Migrations

- Run makemigrations and migrate to create the database table for your model.

```
python manage.py makemigrations
```

```
python manage.py migrate
```

Part 3: Create forms

Write a form for feedback submission.

Task:

- Build a FeedbackForm that validates user input for the comment and rating fields.

Part 4: Develop Views

Create views to display items and handle feedback submissions.

Task:

- Write a view to show item details along with a list of feedback.
- Write a view to handle feedback submission.

Part 5: Design templates

Create a template to display the item and its feedback, and include a form for new feedback.

Task:

- Display the item's name, average rating, and existing feedback.
- Include a form for submitting new feedback.

Part 6: configure URLs

Define routes for viewing items and handling feedback.

Task:

- Add a URL pattern for the item detail view.

Part 7: Test and deploy the system

- Add items using the Django admin or shell.
- Visit an item's detail page to view and submit feedback.
- Verify feedback is stored in the database and displayed correctly.

Submission Requirements

1. Code Structure

- Ensure code is organized into models, views, urls, templates, and forms.
- Keep code clean and follow Django best practices.

2. Documentation

- Include a README.md file that describes the project and provides instructions on how to set up and run the app.

3. Publish Django

- Publish your Django project through Heroku or pythonanywhere. Will be shown in during class lecture.

Evaluation Criteria

1. Completeness: Does the project include all required views, templates, and functionality?
2. Code Quality: Is the code well-organized and readable?
3. UI and Design: Is the application user-friendly and visually clean?
4. Optional Features: Extra credit for basic styling and test cases.

Lab schedule

1. Complete Part 1, 2, and 3 during the class on Monday, November 18.
2. Complete Part 4, 5, and 6 during the class on Friday, November 22.
3. Complete Part 7 during class Monday, November 25

Grading:

- 10 points. Grade Part 1, 2, and 3 by the end of class on Monday, November 18.
- 10 points. Grade Part 4, 5, and 6 by the end of class on Friday, November 22.
- 30 points. Publish completed app by Sunday, November 24.
- TOTAL POINTS: 50 points.
